

G.6.1.1. Milling cutter / rental service

- 45°-milling cutter: With this tool, you can easily chamfer the bottom bracket shell on both sides to prepare for the installation with cone rings.

In many countries we have a rental tool service: you use the tool and then send it to the next customer in your country.

Remark: new and very sharp tools may cause a kind of "chatter marks". These marks even increase form closure and aren't disadvantageous at all.
