

## H.1. Recommended service intervals

We recommend to lube a gearing system once or twice a year with 1-2 ml out of the syringe with original MoS2-lube from Schlumpf.

Every 5'000 km check the chainring for side play. Don't confound side play with a play in the direction of circumference of the chainring, which is normal and necessary for proper shifting!

Also a minor play in the direction of the spindle is normal, as it helps to avoid side load on the left industrial bearing. -> H.4.
